

The First U-Trough Technology in Malaysia

- U-trough technology is a world class technology that is being utilised for the first time in a railway project in Malaysia.
- Timely construction schedule: one span can be installed in a day versus 3 days using the Segmental Box Girder (SBG) method.
- Integrated design with in-built noise barrier.
- Ensure minimal disruption to the surrounding areas.
- Generally lighter compared to SBG in the same span length hence more flexible in terms of launching method and construction sequence.
